

## Report on Installation of Roombr Technology

The Roombr technology recently installed at the JSS AHER Department of Health System Management has significantly enhanced our teaching and learning environment. Detailed training sessions were conducted for the faculty, focusing on the comprehensive use of this innovative system. These sessions included hands-on demonstrations and practical exercises, ensuring that all faculty members are proficient in utilizing Roombr's advanced features. The training covered the system's integration capabilities, user interface navigation, and troubleshooting procedures, equipping the faculty with the necessary skills to maximize the technology's potential in their academic activities.

What sets the Roombr system apart is its unique, all-in-one design, which includes an inbuilt CPU, speaker, recorder, and projector. This interactive system is designed to facilitate seamless interaction, making it an invaluable tool for engaging students in a more dynamic and immersive learning experience. The faculty particularly appreciated the ease with which they could integrate multimedia resources into their lectures and the system's ability to record sessions for future reference. This focus on interaction and user-friendly features makes Roombr a standout addition to our department's technological infrastructure.
